### Triple-Blend Media Removes Odors from Engine Exhaust

**DORAVILLE, Ga.**—Purafil, Inc., the leading manufacturer of air filtration systems for the removal of odors and gaseous pollutants, unveils a new product, Triple-Blend Makeup Air Media in disposable plastic modules. Triple-Blend Makeup Air Media is targeted at the removal of diesel exhaust, jet fuel fumes and automobile emissions from makeup airstreams in commercial facilities.

Purafil's Makeup Air Media is composed of a blend of the following three patented Purafil chemical filtration media: Puracarb<sup>®</sup> for removal of nitrogen dioxide, Purafil<sup>®</sup> Select for removal of nitric oxide and sulfur dioxide and Purakol<sup>®</sup> for removal of hydrocarbons — all gaseous pollutants that comprise engine exhaust.

Triple-Blend Makeup Air Media is housed in disposable plastic modules that are constructed of recyclable polystyrene plastic and require no emptying or refilling. When the media inside the module is spent, the old module is simply replaced with a new one. The modules slide easily into and out of Purafil's front and side access systems; no tools are required.
